Capturing and Analysing Packets Using Wireshark

Aim

To capture and analyse network packets using the **Wireshark** tool.

Background

Wireshark is a **network packet analysis tool** used to capture and study network traffic. It displays information about different protocols such as **TCP, UDP, ARP, DNS, HTTP, ICMP and DHCP**.

Requirements

- Computer
- Wireshark software
- Network connection
- Ethernet/LAN interface

Procedure

1. Open **Wireshark**.
2. Select the **Local Area Connection**.
3. Go to **Capture → Options**.
4. Set the capture limit to **100 packets**.
5. Start the packet capture.
6. Apply filters such as:
    - `tcp` – TCP packets
    - `udp` – UDP packets
    - `arp` – ARP packets
    - `dns` – DNS packets
    - `http` – HTTP packets
    - `icmp` – ICMP packets
    - `dhcp` – DHCP packets

7. Observe and analyse the captured packets.
8. Save the captured packets for future reference.

Result

Thus, the network packets were successfully **captured and analysed using Wireshark**.
